

Update instructions:

Important: We changed the database majorly for better expandability and better mobile app performance in version 1.3 so if you want to update from version 1, 1.1 or 1.2 to version 1.3, you should perform a fresh installation so your previous data will be lost. We suggest it for using future updates...

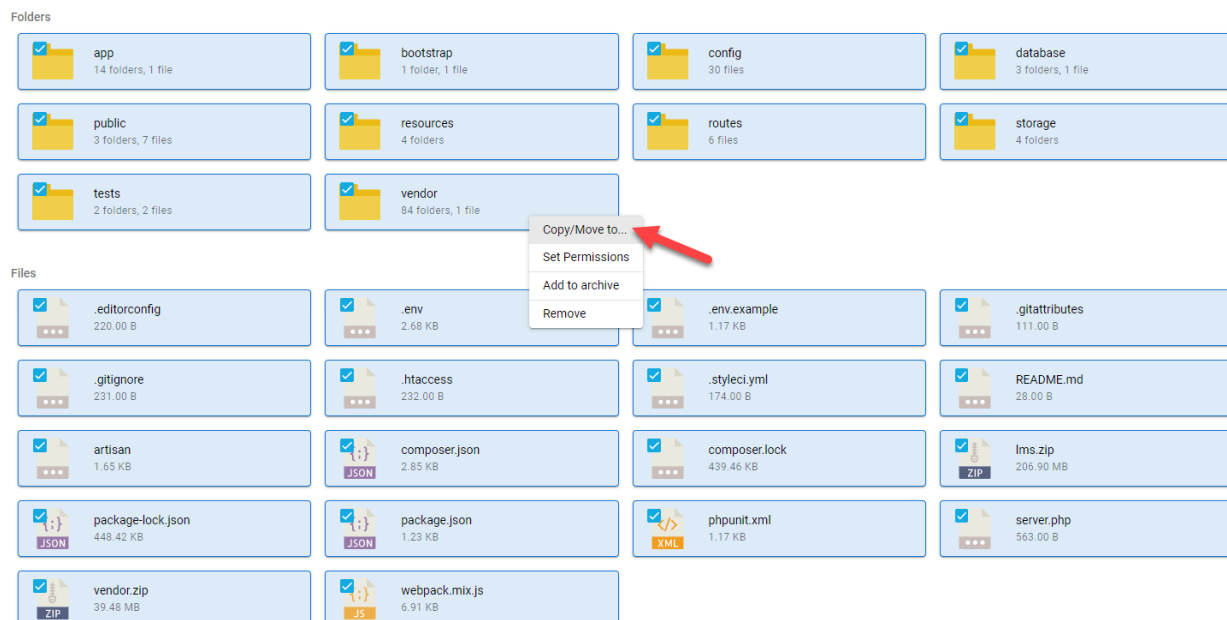

If you want to update from version 1.3 to 1.4 you can update it according to this documentation.

There are two ways to update your website to the latest version:

- Fresh installation: You can install the updated version from scratch according to installation instructions. Your data will be lost.
- Upgrade the existing version to the latest version without losing data.

How to upgrade to the latest version without losing data?

Step 1: Open your hosting file manager and move all of your website folders and files to a new folder. (e.g. oldfiles).

Step 2: Upload the “Update.zip” that exists in the downloaded package (Update/Update files/Update.zip) file to your host and extract it in your domain folder (In most cases public_html).

Step 3: Go to your “old files” folder created in step #1 and copy the following files or folders from your old version to the new version:

Type (Folder/File)	Path
File	Oldfiles/.env
File	Oldfiles/.htaccess
File	Oldfiles/public/.htaccess
Folder	Oldfiles/resources/lang
Folder	Oldfiles/public/store

You can request update service from [this link](#). Our developers will update your website.

Note: The version that you downloaded from Codecanyon is not built version. You can download the latest version of the easy installation or update package from [our CRM](#) once each update releases.

Step 4: The database structure changes in updates mostly. If you don’t have data on your website and use it with the demo data, you can import databases included in the package so you will have a website the same as our live demo.

If your website includes functional data like users, courses, etc, you need to transfer your old database data to the new database.

You can transfer your data using tools like Navicat or contact support, we will transform your old database to the new database. This is a free service.

Note: If you updated your platform, copy the “resources/lang/en/update.php” file to your website language folder to add new translation phrases.
